

Skin

A close-up, macro photograph of human skin. The skin is a warm, reddish-brown color. Numerous fine, dark hairs are visible, growing in a somewhat regular pattern across the surface. The lighting is soft, highlighting the texture and individual hairs.

Maj Rishi Pokhrel

Anatomy

NAIHS

At the end of this class you should be
able to ...

- Describe gross & microscopic structure of skin
- Enumerate functions of skin
- Appreciate importance of anatomy of skin in clinical practice

Integumentary system

Integumentary - covering; covers outside of the body

Consists of:

- Skin & appendages
 - Hair
 - Nails
 - Glands

Introduction

- Largest organ
- Continues m/m at orifices
- 7 % of body weight
- Surface area: 1.5 to 2 Sq. meters
- Thickness: 0.5 to 3mm
- Consists of:
 - Epidermis
 - Dermis

Layers

- Dermis
 - Deep layer, connected to hypodermis
 - 2 layers
 - Superficial papillary layer
 - Deep reticular layer

Dermis: papillary layer

- Loose CT with collagen & elastic fibers
- Peg-like projections -**dermal papillae** - fit into reciprocal depressions on undersurface of epidermis
- Dermal papillae contain capillary loops & free nerve endings

Dermis: Reticular Layer

- Main layer
- Elastin & collagen produce:
 - Structural strength
 - Cleavage lines
 - Stretch marks- striae

 **Papillary dermis**

 **Reticular dermis**

- Epidermis
 - Avascular
 - 5 Layers
 - Str sq ker ep

Stratum corneum

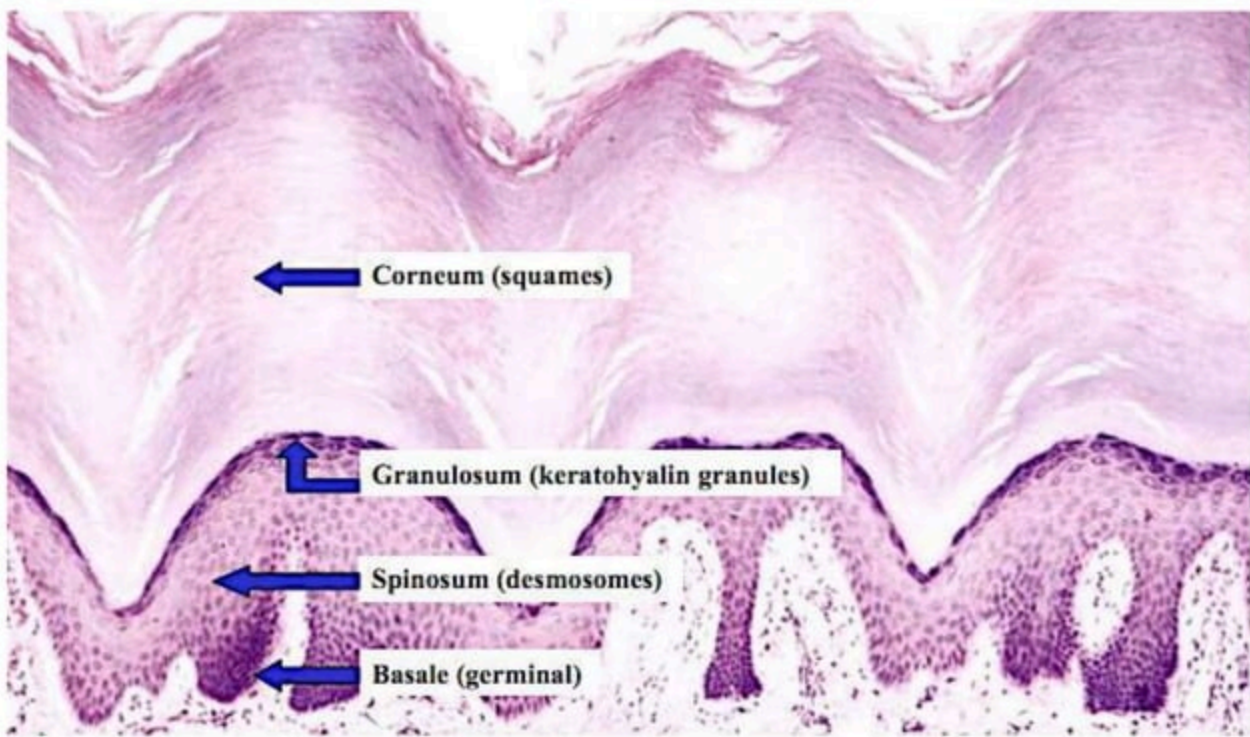

Stratum lucidum

Stratum granulosum

Stratum spinosum

Stratum basale

**Dermal papilla
extending into
the epidermis**

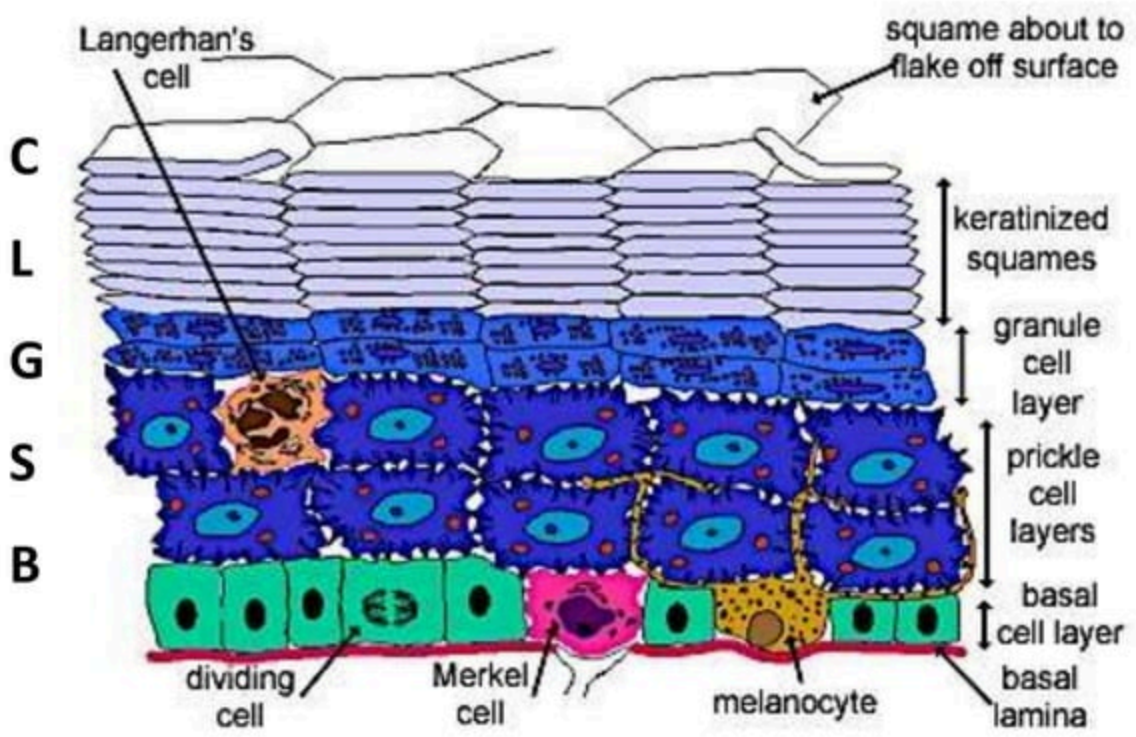

4 distinct cell types: 1) Keratinocyte, 2) Melanocyte, 3) Langerhans cell, 4) Merkel cell

Epidermis: cells

- **Keratinocytes:** Produce keratin for strength
- **Melanocytes:** Contribute to skin color
- **Langerhans' cells:** Part of immune system
- **Merkel's cells:** Detect light touch & pressure

Langerhans cell: dendritic processes; antigen presentation

Melanocyte: neural crest origin; no desmosomal attachments

Desmosomes in the stratum spinosum

Desmosomes: false intercellular bridges

Appendages

- **Hair**

- Except palms, soles, lips, nipples, parts of external genitalia & distal segments of fingers & toes

- **Glands**

- Sebaceous

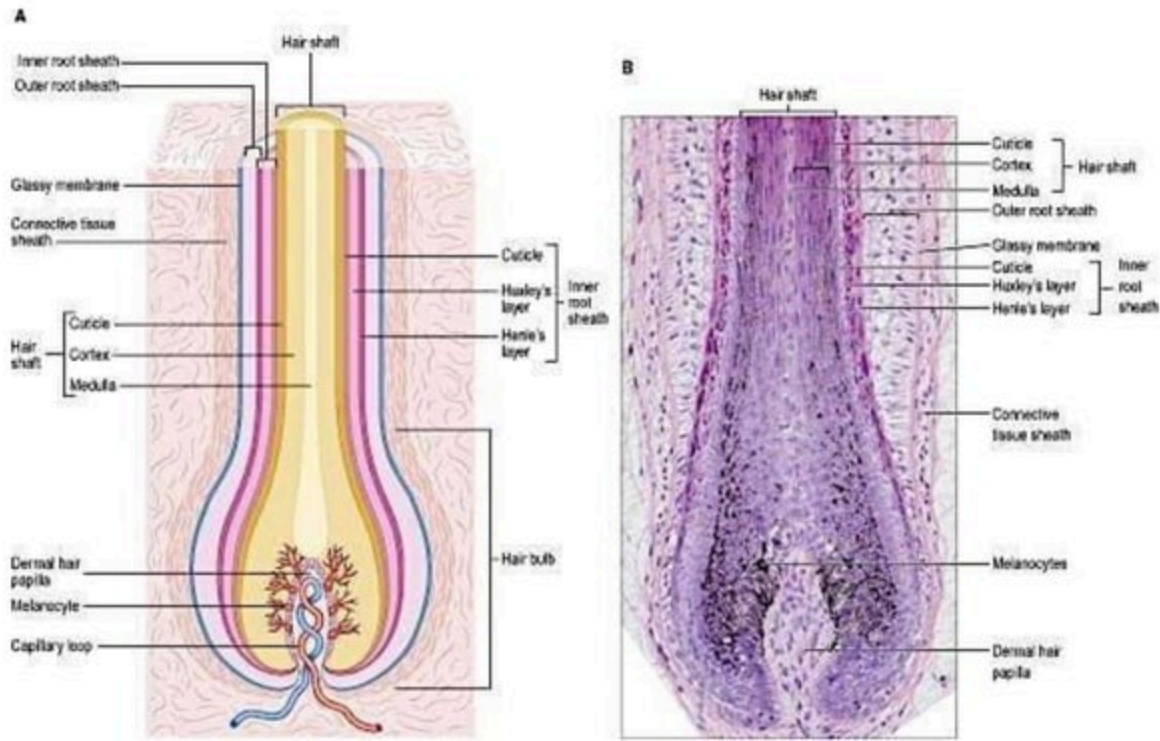

- Sudoriferous (sweat)

- Ceruminous

- Mammary

- **Nail**

Hair

Hair

Sweat glands

- **Sweat** - blood filtrate
 - 99% water with some salts
 - Contains traces of metabolic wastes
- **Types:**
 - **Eccrine gland**
 - Most numerous – produce true sweat
 - **Apocrine gland**
 - Confined to axillary, anal & genital areas
 - Produce special kind of sweat

Merocrine (eccrine) Sweat Glands

Sebaceous glands

- Over entire body except palms & soles
- Simple alveolar glands
- Secrete sebum- oily substance
- Holocrine secretion – entire cell breaks up to form secretion
- Functions - Softens & lubricates hair & skin

Sebaceous Glands

Nail

- Scale-like modification of epidermis on the distal, dorsal surface of fingers & toes
- Parts: Free edge, Body, Root, Nail folds, Eponychium, Lunula

Cleavage lines (Lines of Langer)

- Elastin & collagen fibers oriented in directions
- Important in surgery
- When incision parallel to lines
 - Less gaping
 - Faster healing
 - Less scar tissue

A

B

An incision made across cleavage lines can gap, increasing the time needed for healing, and result in increased scar tissue formation.

An incision made parallel to cleavage lines results in less gapping, faster healing, and less scar tissue.

Dermatome

Skin color

Determined by 3 factors

1. Pigments
 - Melanin
 - Carotene
 - **Albinism**: Deficiency or absence of pigment
2. Blood circulating through skin
 - Imparts reddish hue- Hb & Oxy Hb
 - **Cyanosis**: Blue color caused by decrease in blood oxygen
3. Thickness of stratum corneum

Functions of skin

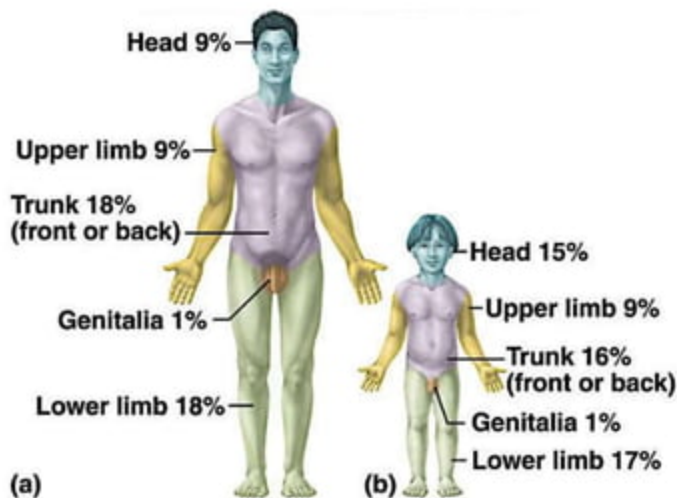

- Protection
- Sensation
- Metabolism
 - Temperature regulation
 - Vitamin D production
 - Excretion
 - Regulation of pH
 - Absorption
 - Secretion
 - Storage

Applied anatomy

- Skin color in clinical conditions
 - Pale - Anemia
 - Yellow - jaundice
 - Blue – cyanosis
- Skin grafts
 - Split thickness grafts - Epidermis & tips of dermal papillae is used
 - Full thickness graft - Both epidermis & dermis is used

Rule of nines

- Estimates severity of burns
- Burns are critical if:
 - Over 25% second degree burns
 - Over 10% third degree burns
 - Third degree burns on face, hands, or feet

Du BOIS FORMULA

To calculate surface area of a person

$$A = W \times H \times 71.84$$

- **A:** Surface area in square cm
- **W:** Weight in kilogram
- **H:** Height in cm
